

## Turn-Lok Jockey Wheels

Turn-Lok™ is a special system incorporated in some of our jockey wheels that helps prevent the handle unwinding when travelling. This eliminates the use of clips, chains or rubber bands that an operator can forget to fix or can become damaged and stops the jockey wheel falling onto the road.

The Turn-Lok™ works automatically without the operator having to remember any additional operations other than when using a standard jockey wheel.

There's a small clicking that occurs when you turn the handle, it's quite normal! **Just turn the handle!**

**Automatic Locking  
Mechanism when  
Handle is turned**
